Introduction

This report summarizes the results from the benthic samples collected for Rockland County in 2015. This project is supported by the Rockland County Soil and Water Conservation District. This data is part of an ongoing assessment of Rockland County stream communities since 2006 (Figure 1); for complete project overview, history, rationale, background, project goals, methods, key terminology and interpretation of 2006 - 2014 data, see Rockland County reports website:

<http://rocklandgov.com/departments/environmental-resources/protecting-our-streams-and-waterways/>

Benthic kick samples were collected at 18 stations on September 8 and 9, 2015. All of the stations sampled had been previously sampled in at least one year during 2006 – 2014; for trend monitoring. Data was analyzed using New York State Department of Environmental Conservation (NYS DEC) methodology to determine a biological assessment profile (BAP), indicating overall water quality at each test site, Impact Source Determination (ISD) which assessed the most likely source (type of impact) affecting water quality, and the Nutrient Biotic Index (NBI) indicating the trophic state of the water at a particular station (see Table 3).

Figure 1. Map of 2006 - 2015 station locations in Rockland County, NY. Watershed delineation and watershed names are based on hydrological drainage units originated by the U.S. Geological Survey New York Water Science Center and U.S Department of Agriculture, New York State Natural Resources Conservation Service (published in 2008). *Indicates the name of the watershed that it is locally known as.

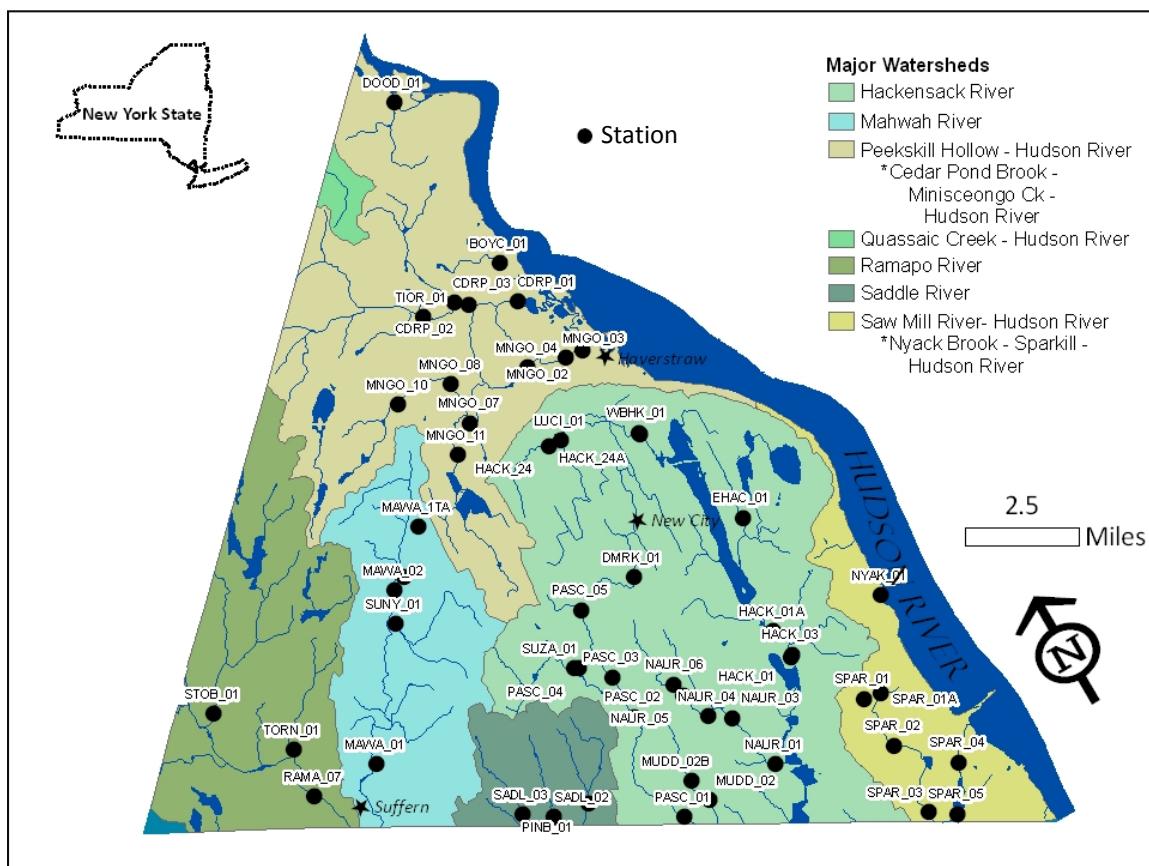

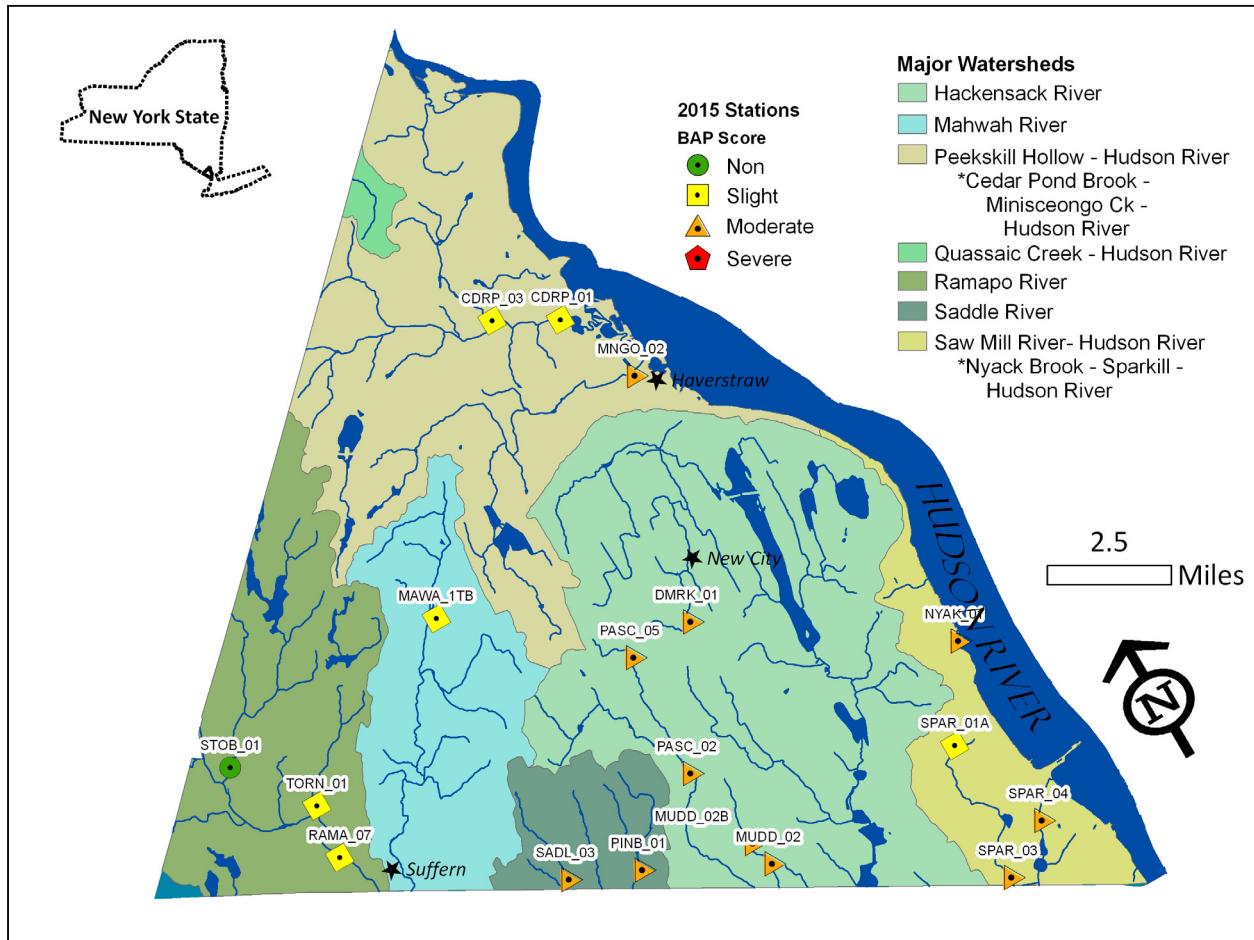

Figure 2. Map of 2015 station locations and BAP category in Rockland County, NY. Watershed delineation and watershed names are based on hydrological drainage units originated by the U.S. Geological Survey New York Water Science Center and U.S Department of Agriculture, New York State Natural Resources Conservation Service (published in 2008). *Indicates the name of the watershed that it is locally known as.

Summary of Results

The 2015 biological community metrics indicated Rockland County water quality ranged from moderately impacted to non impacted: 1 site was non impacted, 6 sites were slightly impacted, and 11 were moderately impacted (Figure 2 and Table 1).

Comparison of the biological assessment profile (BAP) for each station to prior data shows water quality declined (BAP dropped at least 0.5 points) at 8 stations, improved at 2 stations, and remained the same at 8 stations (Table 2). Of the 8 stations with declining water quality, the BAP remained within the same impact category at 4 stations and dropped into a lower water quality category at 4 stations (Table 2). Of the two stations with improved water quality one remained within the same impact category while the other, NYAK 01, changed from the severe to the moderately impacted category (Table 2).

The variability in water quality is partially a function of land use in each of the major stream basins, which affects the amount and the nature of storm water runoff. In a natural state (grassy or forested areas), rainwater seeps into the ground, where it is filtered, recharges ground water, and contributes to a steady state flow in lotic systems during times of low rainfall. Agricultural alteration of the land increases the amount of water that flows over the surface directly into streams. The result is diminished amounts of available groundwater, significant changes in river flow during wet or dry periods, and the deposition of chemicals such as fertilizer and pesticides and of animal waste directly into rivers and streams. Urban land use, with large imperious surfaces such as roads, parking lots, driveways, and rooftops results in the highest level of runoff, and is therefore the most likely to cause both flooding and stream channel erosion as large volumes of water carry urban contaminants (oil and petroleum products, road salt, industrial chemicals, lawn fertilizers and pesticides, and litter) rapidly into waterways through storm sewers or across imperious surfaces.

Since 2006, areas of Rockland County with a higher percentage of forested land have exhibited higher water quality scores than areas of considerable urban development or agriculture (figure 3). Forested areas usually contain fewer sources of pollutants and superior ability to buffer impacts; pollutants are removed from the water as it filters through the soil. The overall impact from agricultural and urban areas is dependent on numerous variables, including the amount of land dedicated to these uses, the volume of impervious surfaces, type and abundance of industry, abundance of automobiles, and management practices.

Figure 3. Percentage of land use and mean BAP scores for years 2006 – 2015 within each major watershed. N = number of samples, dashed line indicates minimum and maximum scores.

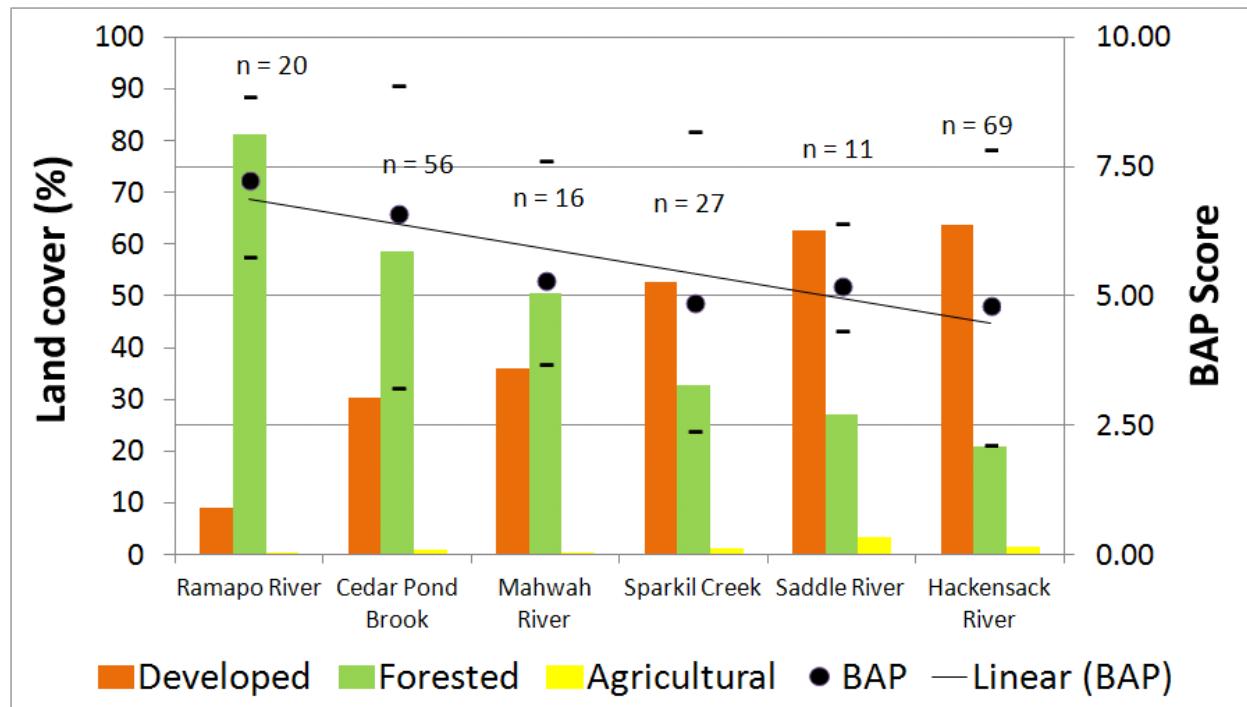

Table 1. Benthic macroinvertebrate metric scores and impact source determination percentages for the 18 stream sites sampled in 2015 throughout Rockland County, NY. Bolded numbers indicate most likely source of impact to stream community. TR= taxa richness; BI= biotic index; EPT = Ephemeroptera-Plecoptera-Trichoptera taxa; PMA= percent model affinity; BAP = biotic assessment profile; Nat=natural; NPN = non-point nutrient; Org = organic inputs; Imp= impoundment; Complex= municipal/industrial/nutrients. NBI-N = Nutrient Biotic Index for nitrogen; NBI-P = Nutrient Biotic Index for phosphorus.

Table 3. Descriptions of the NYS metrics and BAP scores calculated (adapted from Smith et al. 2009).

Metric	Description	Sample Type	Predicted response to impact
Taxa Richness (TR)	Species richness is the total number of unique species or taxa found in the subsample. Higher species richness indicates higher water quality.	Kick	Decrease
Ephemeroptera-Trichoptera-Plecoptera (EPT) Richness	EPT Richness is the total number of taxa of mayflies (Ephemeroptera), stoneflies (Plecoptera), and caddisflies (Trichoptera) found in a subsample. These are considered to be mostly clean-water organisms, and their presence may indicate good water quality.	Kick	Decrease
Hilsenhoff's Biotic Index (BI)	Biotic index is calculated by multiplying the number of individuals of each species or taxa by its assigned tolerance value, summing these products, and dividing by the total number of individuals. Tolerance values range from intolerant (0) to tolerant (10). High biotic index values are suggestive of organically enriched condition, while low values indicate naturally occurring, ambient communities.	Kick	Increase
Percent Model Affinity (PMA)	This is a measure of similarity to a model non-impacted community based on percent abundance in 7 major groups to measure similarity to a kick sample community of 40% Ephemeroptera, 5% Plecoptera, 10% Trichoptera, 10% Coleoptera, 20% Chironomidae, 5% Oligochaeta, and 10% Other. The lower the similarity value the greater the impact.	Kick	Decrease
Biological Assessment Profile (BAP)	BAP is the assessed impact for each station. The BAP score is the mean value of the above metrics after converting each metric score to a common scale of 0-10. The higher the BAP score, the better the assessed impact category. There are four impact categories in NYS: non-, slight, moderate, or severe impact.	Kick	Decrease
	The NYS impact categories and representative BAP scores are: Non-Impact 7.51 – 10, Slight Impact 5.01-7.5, Moderate Impact 2.51- 5, Severe Impact 0- 2.5.		

Table 4. Nutrient Biotic Index (NBI) Ranges and trophic state.

Trophic state for NBI	NBI
Eutrophic	6.01-10
Mesotrophic	5.01-6
Oligotrophic	0-5

Appendix

A Field and Lab Data Summary page was created for each of the stations sampled, including: site location, number, sampling date, physical and chemical data, and site photos as well as the taxa identified for each sub-sample.

Field Crew: **cmf, kh**

Site description: **Just above tennis courts**

Physical Characteristics

Depth (meters):	0.15
Width (meters):	3
Current (cm/sec):	110
Canopy (%):	55
Substrate	
Rock (%):	20
Rubble (%):	40
Gravel (%):	25
Sand (%):	10
Silt (%):	5
Embeddedness (%):	25

Chemical Measurements

DO (mg/L):	10.78
DO sat. (%):	120.2
Temperature (C):	20.84
Spec. Conduct. (umhos):	1191
Baro pressure:	760.9
pH:	8.59
Salinity (PSS):	0.59

Biological Attributes

Aquatic vegetation	
Macrophytes:	
Diatoms:	Y
Algae-suspended:	
Algae-filamentous:	Y
Occurance of macroinvertebrates	
Ephemeroptera:	
Plecoptera:	
Trichoptera:	Y
Coleoptera:	
Megaloptera:	
Odonata:	
Chironomidae:	Y
Simuliidae:	
Decapoda:	
Gammaridae:	
Mollusca:	
Oligochaeta:	Y
Other macro's:	

Field Faunal Condition: **Very poor**

WAA Project: RC

Lab Data Summary

Waterbody: Nyack Brook

Station: NYAK 01

Replicate: A

Collection Date: 9/8/2015

Subsample size: 100

Order	Family	Final Determination	Total #
DIPTERA	Ceratopogonidae	Atrichopogon sp.	3
	Chironomidae	Cricotopus bicinctus	12
		Cricotopus sp.	4
		Cricotopus/Orthocladius Complex	4
		Dicrotendipes sp.	1
		Limnophyes sp.	1
		Polypedilum illinoense	13
	Empididae	Hemerodromia sp.	9
	Simuliidae	Simulium sp.	2
	Tipulidae	Limonia sp.	1
HOPLONEMERTEA	Tetrastemmatidae	Prostoma graecense	3
TRICHOPTERA	Hydropsychidae	Ceratopsyche bronta	5
		Ceratopsyche sparna	2
TRICLADIDA		Undetermined Turbellaria	40
